

LamaPLC: MQ Winsen Gas-sensors

Winsen's MQ series gas sensors are low-cost, semiconductor-type (chemiresistive) sensors designed to detect a wide range of gases, including flammable gases, alcohol, and smoke. Each model is tailored to detect specific gases or a range of gases.

- **Operating Principle:** The sensors use a sensitive material (typically SnO₂ semiconductor) and a heating element. The sensor's conductivity varies with air-gas concentration, enabling measurement using a simple voltage divider.
- **Voltage:** They operate on a standard 5-volt DC power supply.
- **Low Cost:** A major advantage is their affordability, making them popular for a wide variety of civil and industrial applications, including smart homes and IoT projects.
- **“Burn-in” Time:** A “burn-in” period of 12 to 24 hours is often recommended to improve measurement accuracy.

Arduino

Interfacing the **MQ-135** air quality sensor with an Arduino can be done either by reading raw analog signals or by using a dedicated library to obtain calibrated PPM (parts per million) readings.

Arduino wiring

| MQ-135 | Pin | Arduino Pin | Description |
|-----------|---------------|--|-------------|
| VCC | 5V | Power supply (the sensor has a built-in heater) | |
| GND | GND | Ground | |
| AOUT / AO | A0 | Analog output (voltage level based on gas concentration) | |
| DOUT / DO | D2 (Optional) | Digital output (goes high/low based on threshold) | |

Arduino code

This code provides a raw reading from 0 to 1023, which is useful for basic threshold detection (e.g., triggering a fan or an alarm).

```
int sensorPin = A0; // Select the input pin for MQ-135

void setup() {
  Serial.begin(9600); // Initialize serial communication
}

void loop() {
  int sensorValue = analogRead(sensorPin); // Read analog value (0-1023)
  Serial.print("Raw Air Quality Value: ");
  Serial.println(sensorValue);
  delay(1000); // Wait 1 second for next reading
}
```

}
